                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparation of yeast artificial chromosomes - by in vivo recombination using vector comprising yeast centromere, marker, yeast telomere and nucleic acid for recombination Example 1; Page 45; 117pp; English.

Example 1; Page 45; 117pp; English.

C This is the nucleotide sequence for the PCR primer used in the complification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Preparation of yeast artificial chromosomes - by in vivo recombination using vector comprising yeast centromere, marker, yeast telemere and nucleic acid for recombination Example 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Primer PDJ33 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation.

protection of neural thread protein in diagnosis of Alzheimer's protesses - also NTP DNA and protein sequences used in gene and antisense therapy antisense therapy bisclosure; Page 48; 238pp; English.

A method for detecting the presence of neural thread protein (NTP) A method for detecting the presence of neural thread protein (NTP) having a molecular weight of 8, 14, 17, 21, 26 or 42 kD in a human subject comprises (a) contacting a sample from a human subject that is suspected of containing the NTP with at least one molecule is suspected of containing the NTP with at least one molecule capable of binding to the protein; and (b) detecting any of the molecule bound to the protein. The binding molecule is selected from an antibody free of natural impurities, a monoclonal antibody or a binding fragment of either of these. The method may be used for diagnosing the presence of Alzheimer's disease, neuroectodermal tumours and a malignant astrocytoma in a human. Expression of NTP nucleic acid may be inhibited using antisense oligonucleotides (See T27739-44).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Disclosure: Page 48: 158pp: English.
077888-077890 are ADIO-7 neural thread protein (NTP) antisense oligonucleotides, that can be used to down regulate or inhibit the expression of the NTP gene. These oligonucleotides could be used in the treatment of the folowing conditions Alzheimer's disease, neuroectodermal tumours, malignant astrocytomas and glioblastomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-NOV-1996 (first entry)

PS Claim 9; Page 29; 39pp; English.
CC T98497-T98520 represent primers used in the method of the invention. The CC method of the invention is for preparing DNA complementary to the 5'-end CC of an RNA molecule. The method comprises annealing a cDNA synthesis CC primer to the RNA molecule and synthesising a first DNA strand CC complementary to at least a portion of the RNA molecule, and contacting the RNA molecule with a template switching oligonucleotides (TSO) (such as T98426) having a pre-selected nucleotide sequence at its 5'-end and at cC least 1 riboguanine residue at its 3'-end, where the TSO binds the 5'-end cof the RNA molecule and serves as a template for the extension of the CC 3'-end of the first DNA strand. The method can be used for the synthesis and cloning of full length cDNA, or fragments, that correspond to the CC construct cDNA libraries from nanogram quantities of total or poly A+ CC RNA. The TSO allows for negative selection against cDNA that are not complementary to the 5'-end of the template RNA, while allowing full CC length cDNA to be readily selected.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PS Claim 9; Page 30; 39pp; English.

CC T98497-T98520 represent primers used in the method of the invention. The CC method of the invention is for preparing DNA complementary to the 5'-end CC of an RNA molecule. The method comprises annealing a cDNA synthesis CC complementary to at least a portion of the RNA molecule, and contacting CC complementary to at least a portion of the RNA molecule, and contacting CC as T98426) having a pre-selected nucleotide sequence at its 5'-end and at CC least 1 riboguanine residue at its 3'-end, where the TSO binds the 5'-end CC in the RNA molecule and serves as a template for the extension of the CC in the RNA molecule and serves as a template for the extension of the CC complete sequence of the 5'-end of the method can be used for the synthesis CC complete sequence of the 5'-end of the mana molecule. It can be used to CRA. The TSO allows for negative selection against cDNA that are not CC complementary to the 5'-end of the template RNA, while allowing full CC length cDNA to be readily selected.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   #8888888888888888888
PT Quantifying genomic DNA by amplification of repetitive sequences - prin presence of internal standard, then comparing amts of amplified genomic DNA and standard, partic. for quality control of recombinant proteins, vaccines, etc.

PS Claim 13; Page 14; 41pp; German.

CC Primers T12508 9 are used to amplify a 146 bp fragment of an Alu repeat sequence in a novel method of quantitating genomic DNA in a sample. The convel method features the addition of a known amount of an internal convel method feature. The template for these primers is the plasmid pAlu-wt which comprises plasmid pCRII contg. nucleotides 148-294 of the Alu repeat sequence given in Nucleic Acid Res., 18 (1990) 6793. The method is esp. useful for the detection of contaminating DNA in the manufacture of therapeutic prods.

DA construct for treating human carcinoma - includes a
DA construct for treating human carcinoma - includes a
DA construct for treating human carcinoma sequences
This enhancer sequence is part of a DNA construct used for treating human carcinoma which contains a cancer therapeutic protein under the control of a promoter and 3 enhancer sequences in a specific 5'-3'
Corder. This enhancer element is derived from the flanking region of the human epithelial cell cytokeratin-8 gene.
Sequence 32 BP; 7 A; 1 C; 8 G; 15 T;

DNA construct for treating human carcinoma - includes a cancer-therapeutic gene under the control of a promoter and a gp. of enhancer sequences claim 1; Fig.6; 54pp; English.

This enhancer element is part of a DNA construct used for treating human carcinoma which contains a cancer therapeutic protein under the control of a promoter and 3 enhancer sequences in a specific 5'-3' order. This enhancer element is derived from the flanking region of the human epithelial cell cytokeratin-8 gene.

PO A polypeptide having trypsin inhibitory activity - for the treatment profile for the profile for trypsin inhibitory activity, mol.wt. 22-28 kD and polypeptide having trypsin inhibitory activity, mol.wt. 22-28 kD and polypeptide having trypsin inhibitory activity, mol.wt. 22-28 kD and polypeptide having trypsin inhibitory activity, mol.wt. 22-28 kD and polypeptide was isolated from human T98G and is useful for treathing bancreattitis, shock, multiple organ failure and disseminated intravascular coagulation. The present sequence is that of an antisense primer used for cloning T98G CDNA coding for the full-length polypeptide.

HIV-LP useful in vaccine formulations - is novel HIV virus distinct from HIV-1 and or HIV-2 viruses

Example; page 7; 75pp; English.

HIV-LP is a new variant of the HIV family. A cDNA first strand synthesised from Pt. 1 pellet using MLV RT. The product was converted into dsDNA and this cDNA was amplified by PCR using primers 055167 and 055168.

                                                                                                                                                                       Ş
                                                                                                                                                                                                                                                                           PT regulating, immunomodulating and many other activities are S lisclosure; Page 86; 139pp; English.

CC The present sequence encodes a portion of a novel human secreted protein can be compared under accession number ATCC 98026. The secreted protein can be used to determine biological activity, to raise antibodies, as tissue that modulate their interactions and as nutritional supplements. It may called have a very wide range of biological activities although no conviction of other cytokines; immunostimulating activity or calculation of other cytokines; immunostimulating/immunosuppressant cantivities (e.g. for treating human immunodeficiency virus infection, concer, autoimmune diseases and allergy); regulation of haematopoiesis (e.g. for treating anaemia or as adjunct to chemotherapy); stimulation treating mounds, periodontal disease, neurological diseases stroke, concer, autoimmune disease, neurological diseases stroke, concerning the control of fertility); chemotactic and chemotherapy; stimulation of fibrosis; inhibition or stimulation of follicle stimulating hormone control of fertility); chemotactic and chemokinetic activities (e.g. for treating infections, tumours); haemostatic or thrombolytic activity (e.g. for treating septic shock, Crohn's cativity (e.g. for treating septic shock, Crohn's as antimicrobials; for treating sportasis or other hyperproliferative disease; for regulation of metabolism, behaviour, and cardid in gene therapy procedures.

C inhibition activitles. It can also be used to research or treat diseases/disorders related to its function.

The partial cDNA clone AP162 was 1st isolated from a human adult placenta cDNA library. The partial cDNA clones AM931, AM610, AM340, AM610, AK633, AK633, AM633, AK633 and AK296 were 1st isolated from a human cross feetal kidney cDNA library. The partial cDNA clones H617 and BB9 were 1st isolated from a human peripheral blood monocyte cell (Th1 Crom a human ovary (PA-1 teratocarcinoma) cDNA library. The partial cDNA clone AW191 was 1st isolated from a human ovary (PA-1 teratocarcinoma) cDNA library. The partial cDNA clones AW210, AM205 and AM310 were 1st isolated from a human foetal broad clones are library. The partial cDNA clones AW211, AM205 and AM319 were 1st isolated from a human foetal brain cDNA clones acount retina cDNA clones AW260 was 1st isolated from a human foetal brain cDNA clones acount retina cDNA clones AR260 was 1st isolated from a human cDNA clones AW201, CNA clone

The invention provides a method for detecting the presence of telomerase cc activity. The method comprises of (a) providing a test nucleic acid, ce .g. the nucleic acid sequence shown in V54635, that will be elongated cc by telomerase; (b) incubating the test nucleic acid with the sample cc nucleic acid, e.g. see V54639, using a detecting the elongated cc nucleic acid, e.g. see V54639, using a detector sequence such as the cc immobilised on a solid support, comprises of a hairpin and/or a felomeric repeat sequence, prior to elongation by telomerase. Detection cc of telomeric repeat sequence, prior to elongation by telomerase. Detection cc carcinogenicity and senescence in cells. The assay is also claimed to be useful for determining the effects of compounds on telomerase activity is claimed to be useful for determining the effects of compounds on telomerase carcinogenicity and senescence in cells. The assay is also claimed to the treatment of cancers.

//note="Organ: placenta; Vector: pAMP10; cDNA was generated from cytoplasmic RNA using a mixture of random DNA hexamers and oligo(dT). From this pool of cDNA, human chromosome 7-enriched cDNA was isolated by direct cDNA selection using chromosome 7 genomic DNA (cosmids). The resulting direct-selected cDNA was cloned into a plasmid vector using a non-directional uracil DNA glycosylase (UDG)-mediated cloning strategy."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /organism="Homo sapiens"

/note="Organ: thymus; Vector: pAMP10; cDNA was generated from cytoplasmic RNA using a mixture of random DNA hexamers and oligo(dT). From this pool of cDNA, human chromosome 7-enriched cDNA was isolated by direct cDNA selection using chromosome 7 genomic DNA (cosmids). The resulting direct-selected cDNA was cloned into a plasmid vector using a non-directional uracii DNA glycosylase (UDG)-mediated cloning strategy."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic search, using sw model

                                                     PT Sequencing nucleic acids by mass spectrometric analysis - for detecting nucleic acids, telomerase activity, oncogene mutations, or processes of the sequences, for diagnosis of disease example li; page 318; 478pp; English.

CC Aprocess has been developed for determining the sequence of a target complete acid. The process comprises: (1) generating at least two craments (F) from the target nucleic acid; and (ii) analysing F by compared primers for use in the mass spectrometric diseases. The process is used to detect genetic diseases comprises: (1) generating at least two specifically claimed primers for use in the mass spectrometric analysis of the above process. The process is used to detect genetic diseases comprises; (1) generation dystrophy, Alzhelmer's (2) generations; infections and cancers; also for establishing compared specifically. Particular applications are diagnosis of converblastoma, detecting telomerase, determining family relationships and HIAA comparibility, and in genetic fingerprinting. Compared with known methods using MS, this process requires fewer specific reagents cand is better suited to automation. Extended primers are shorter; primer annealing is more efficient and the process allows detection of conjugation of the process sample from the present invention.

                                                                                                                                                                                                                                                                                                                                    PT Detection of polymorphic genetic markers of the form
pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols as primers
ps Disclosure; Column 11-12; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences
cC thaving the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
cc markers. Primers based on these sequences can be used to detect these
cC repeats, especially for use in e.g paternity or maternity testing,
cc human genetic analysis such as linkage analysis of genetic disease,
cc containing the repeat sequences were isolated by hybridisation of
cc containing the repeat sequences were isolated by hybridisation of
cc cromosome-specific phage libraries with a synthetic poly(dC-dA), (dG-dT)
crobe. Over 100 repeat blocks were isolated. The inserts from the clones
cc were amplified by primers T65798-T66047. Those clones where the repeat
cc sequence has been determined are shown in T65704-797. This repeat
cc sequence is from the marker clone Mdf67 which contains the repeat
cc sequence having the formula: (TC)12(AC)18.

PT Detection of polymorphic genetic markers of the form [dC-dA)n(dC-dT)n - using novel nucleic acid mols. as primers PT (dC-dA)n(dC-dT)n - using novel nucleic acid mols. as primers PS Example 8; Column 57-58; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic CC markers. Primers based on these sequences can be used to detect these CC markers. Primers based on these sequences can be used to detect these CC markers. Primers based on these sequences can be used to detect these CC commercial animal or plant breeding or pedigree analysis of genetic disease, CC commercial animal or plant breeding or pedigree analysis.

CC 1) perfect repeats which are alternating tandem CA repeats with no CC interruptions and without adjacent repeats of another sequence; CC 2) imperfect repeats which are defined as 2 or more runs of uninterrupted CC 3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases; CC 3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least CC (dC-dA)n (dG-dT)n, or from at least 10 uninterrupted mononucleotides; and CC injureriect compound repeats which are defined as for the perfect compound repeats except that the runs of CA are interrupted.

CC This sequence is an example of a compound imperfect repeat sequence of structure: T(CT)12GTT(TC)11T(CA)14A(AC)6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pr Detection of polymorphic genetic markers of the form pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers Disclosure; Column 9-10; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic CC markers. Primers based on these sequences can be used to detect these CC repeats, especially for use in e.g paternity or maternity testing, CC human genetic analysis such as linkage analysis of genetic disease, CC commercial animal or plant breeding or pedigree analysis. Clones CC containing the repeat sequences were isolated by hybridisation of CC chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC grobe. Over 100 repeat blocks were isolated. The inserts from the clones CC were amplified by primers T65798-T66047. Those clones where the repeat CC sequence has been determined are shown in T65704-797. This repeat CC sequence is from the marker clone Mdf39 which contains the repeat CC sequence having the formula: (TC)12.5GTT(TC)11.5(CA)14A(CA)5.5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                       PT Detection of polymorphic genetic markers of the form
PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
PS Disclosure; Column 13-14; 186pp; English.
CC The invention relates to the isolation of polymorphic repeat sequences
CC having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC markers. Primers based on these sequences can be used to detect these
CC comman genetic analysis such as linkage analysis of genetic disease,
CC commercial animal or plant breeding or pedigree analysis. Clones
CC containing the repeat sequences were isolated by hybridisation of
CC chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT)
CC grobe. Over 100 repeat blocks were isolated. The inserts from the clones
CC were amplified by primers T65798-T66047. Those clones where the repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence is from the marker clone Mdfil0 which contains the repeat
CC sequence 46 BP; 12 A; 0 C; 0 G; 34 T;

pr detection of polymorphic genetic markers of the form
pr (dd-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
Claim 1; Column 13-14; 186pp; English.

CC The invention relates to the isolation of polymorphic repeat sequences
CC The invention relates to the isolation of polymorphic repeat sequences
CC markers. Primers based on these sequences can be used as genetic
CC markers. Primers based on these sequences can be used to detect these
CC repeats, especially for use in e.g paternity or maternity testing,
CC human genetic analysis such as linkage analysis of genetic disease,
CC containing the repeat sequences were isolated by hybridisation of
CC containing the repeat sequences were isolated by hybridisation of
CC chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT)
CC corobe. Over 100 repeat blocks were isolated. The inserts from the clones
CC were amplified by primers T65798-T66047. Those clones where the repeat
CC sequence has been determined are shown in T65704-797. This repeat
CC sequence is from the marker clone Mdf120 which contains the repeat
CC sequence 50 BP; 20 A; 25 C; 0 G; 5 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PT Detection of polymorphic genetic markers of the form

                                                                                                                                                                                                                                                                                                                                                                                                  PT Polymorphic bovine DNA markers - used in genetic identification,
PT gene mapping, and selective breeding
PS Table 7; Page 170; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC screening a library of bovine MboI DNA fragments of between
CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC one out of 50 clones cross-hybridised. Assuming independent
CC distribution of microsatellites and MboI sites, the frequency of
CC (T6)n > microsatellites in the bovine genome is estimated at >100,
CC 000. The sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC were used to generate the required PCR primers for in vitro
CC amplification of the corresp. microsatellite sequence
CC amplification of the corresp. microsatellite (using the program
CC optified of the corresp. microsatellite in the program
CC or parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economic trait
CC craits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PT Polymorphic bovine DNA markers - used in genetic identification, proceeding gene mapping, and selective breeding PT Table 7; Page 241; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by CC screening a library of bovine MboI DNA fragments of between CC 250 and 500 bp with an (AC)15 and a (TC)15 olligonucleotide probe. CC One out of 50 clones cross-hybridised. Assuming independent CC distribution of microsatellites and MboI sites, the frequency of CC (T6)n > microsatellites in the bovine genome is estimated at >100, CC is summarised in the specification and indexed herein (see below). CC The sequence upstream and downstream of the microsatellite sequence were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program CC oppirprimy). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait CC craits esp. in cattle, to allow selective breeding.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pri gene mapping, and selective breeding

Pri gene mapping, and selective breeding

RS Table 7; Page 176; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by

CC screening a library of bovine MbcI DNA fragments of between

CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.

CC One out of 50 clones cross hybridised. Assuming independent

CC distribution of microsatellites and MbcI sites, the frequency of

CC (T6)n > p microsatellites in the bovine genome is estimated at >100,

CC 000. The sequence information for ca. 230 such bovine microsatellites

CC is summarised in the specification and indexed herein (see below).

CC The sequences upstream and downstream of the microsatellite sequence

CC were used to generate the required PCR primers for in vitro

CC amplification of the corresp. microsatellite using the program

CC OPTIPRIM). The microsatellites may be used to identify individuals,

CC for parentage testing, and in the genetic mapping of economic trait

CC loci, or genes involved the determinism of economically important

CC see also 033501-34437.

                                                                                 ននិនិនិនិនិនិនិនិ
                                                                     PT Polymorphic bowine DNA markers - used in genetic identification, program appling, and selective breeding fable 7: Page 141; 517pp; English.

CC The sequence is that of a bowine microsatellite sequence obtd. by cc screening a library of bowine MboI DNA fragments of between CC 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. CC One out of 50 clones cross-hybridised. Assuming independent CC (15)n >9 microsatellites and MboI sites, the frequency of CC (75)n >9 microsatellites in the bowine genome is estimated at >100, CC (00). The sequence information for ca. 230 such bowine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence camplification of the corresp. microsatellite (using the program CC were used to generate the required PCR primers for in vitro amplification of the corresp. microsatellite (using the program CC oppirRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic mapping of economic trait CC traits esp. in cattle, to allow selective breeding.

It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of t sequence of DNA is known. Using the methods large fragments of DNA be easily cloned and analysed.

PT Preparation of yeast artificial chromosomes - by in vivo
PT recombination using vector comprising yeast centromere, marker,
PT yeast telomere and nucleic acid for recombination
PS Example 1; Page 45; 117pp; English.

CC This is the nucleotide sequence for the PCR primer used in the
CC amplification of the Alu repeat sequence, which is used to
Cd demonstrate the processes described in the invention. It involves
CC the creation and use of circular yeast artificial chromosome (YAC)
CC to selectively clone specific nucleic acids from a background of
CC mixed nucleic acids by introducing the vector(s) into E. coli cells.
CC They can be used to rapidly isolate human DNA where only a part of the
CC sequence of DNA is known. Using the methods large fragments of DNA can

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be passive cloned and analysed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 98-110234/10.
